

Precipitation Estimation from Remotely Sensed Information using Artificial Neural Networks using G-WADI CHRS iRain.

MARRIOTT HOTEL KIGALI, March 20, 2019

Jonah KAZORA (Meteo-Rwanda)
Dominique MVUNABANDI (CNRU)
Charles Kasanziki (UR)

CHRS - UCI

Overall objective: To build capacity through equitable access to relevant information and the development of means to extend the benefits of space and weather agencies' vast technological resources, for a mitigation of Hydrologic Disasters.

Specific objectives:

- To improve hydrologic prediction through development and refinement of hydrologic models and use of advanced observations, particularly from remote sensing sources;
- To develop decision support tools for generating and evaluating a variety of hydro-meteorological and hydro-climatologic information required by the water resources management community
- To develop mathematical algorithms capable of estimating precipitation both from space-based and in-situ observations at spatial and temporal resolutions relevant to hydrologic applications, particularly in the semi arid environments;
- To contribute to the education of well-trained hydrologists and water resources engineers responsive to the growing needs of public and private sectors at the state, national and international levels.

Satellite Data for Precipitation estimation

*Geostationary IR
Cloud top data
15-30 minute temporal
resolution*

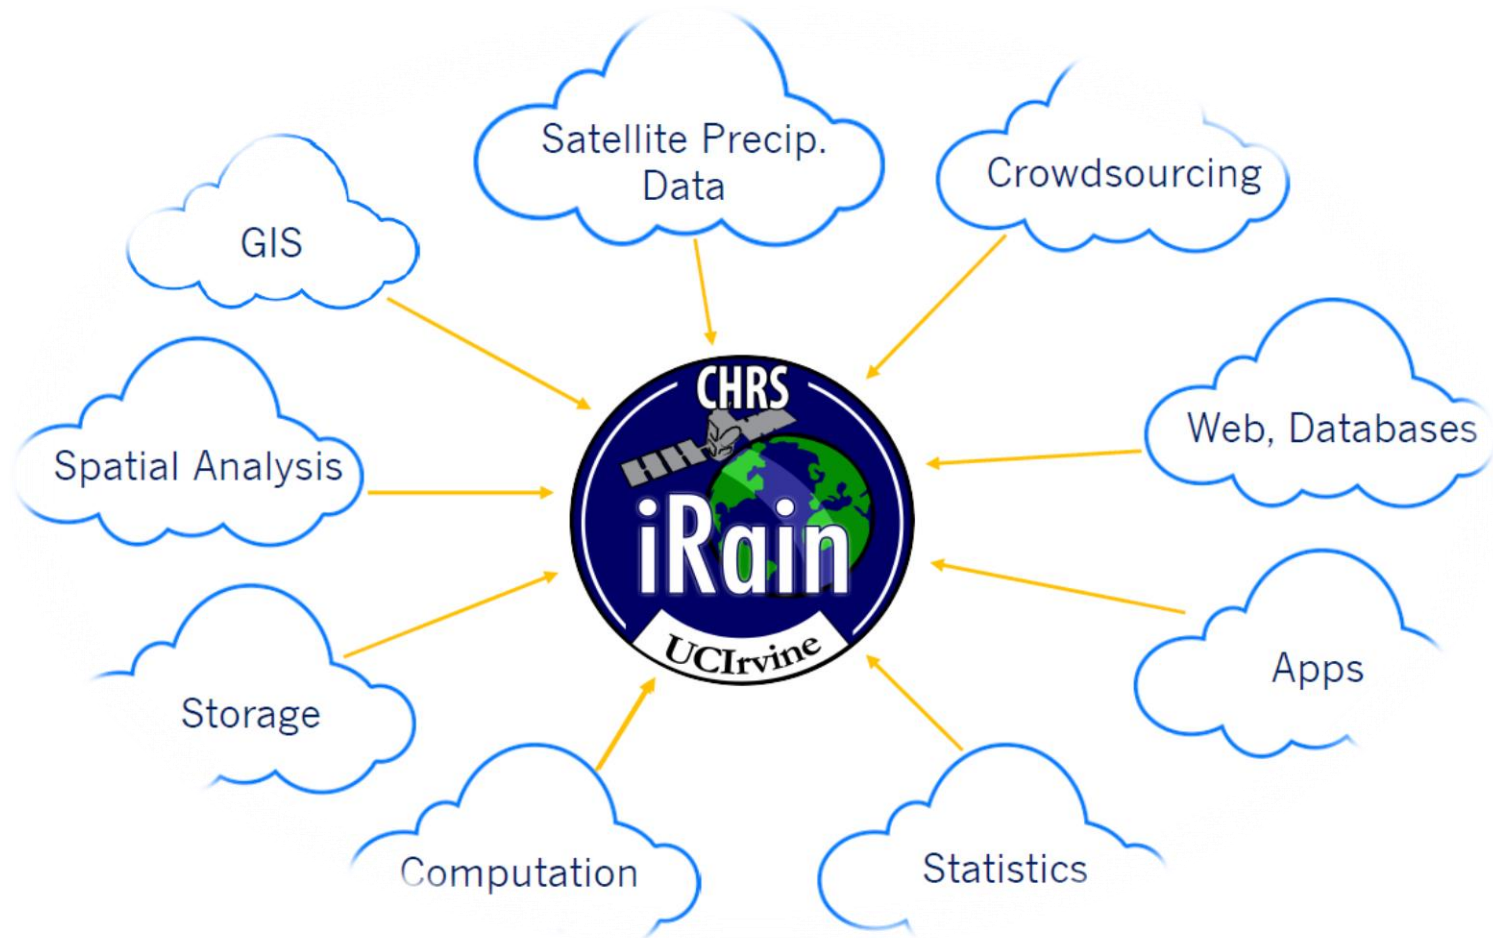

*Passive Microwave (SSM/I)
Some characterisation of rainfall
~2 overpasses per day per
spacecraft, moving to 3-hour
return time (GPM)*

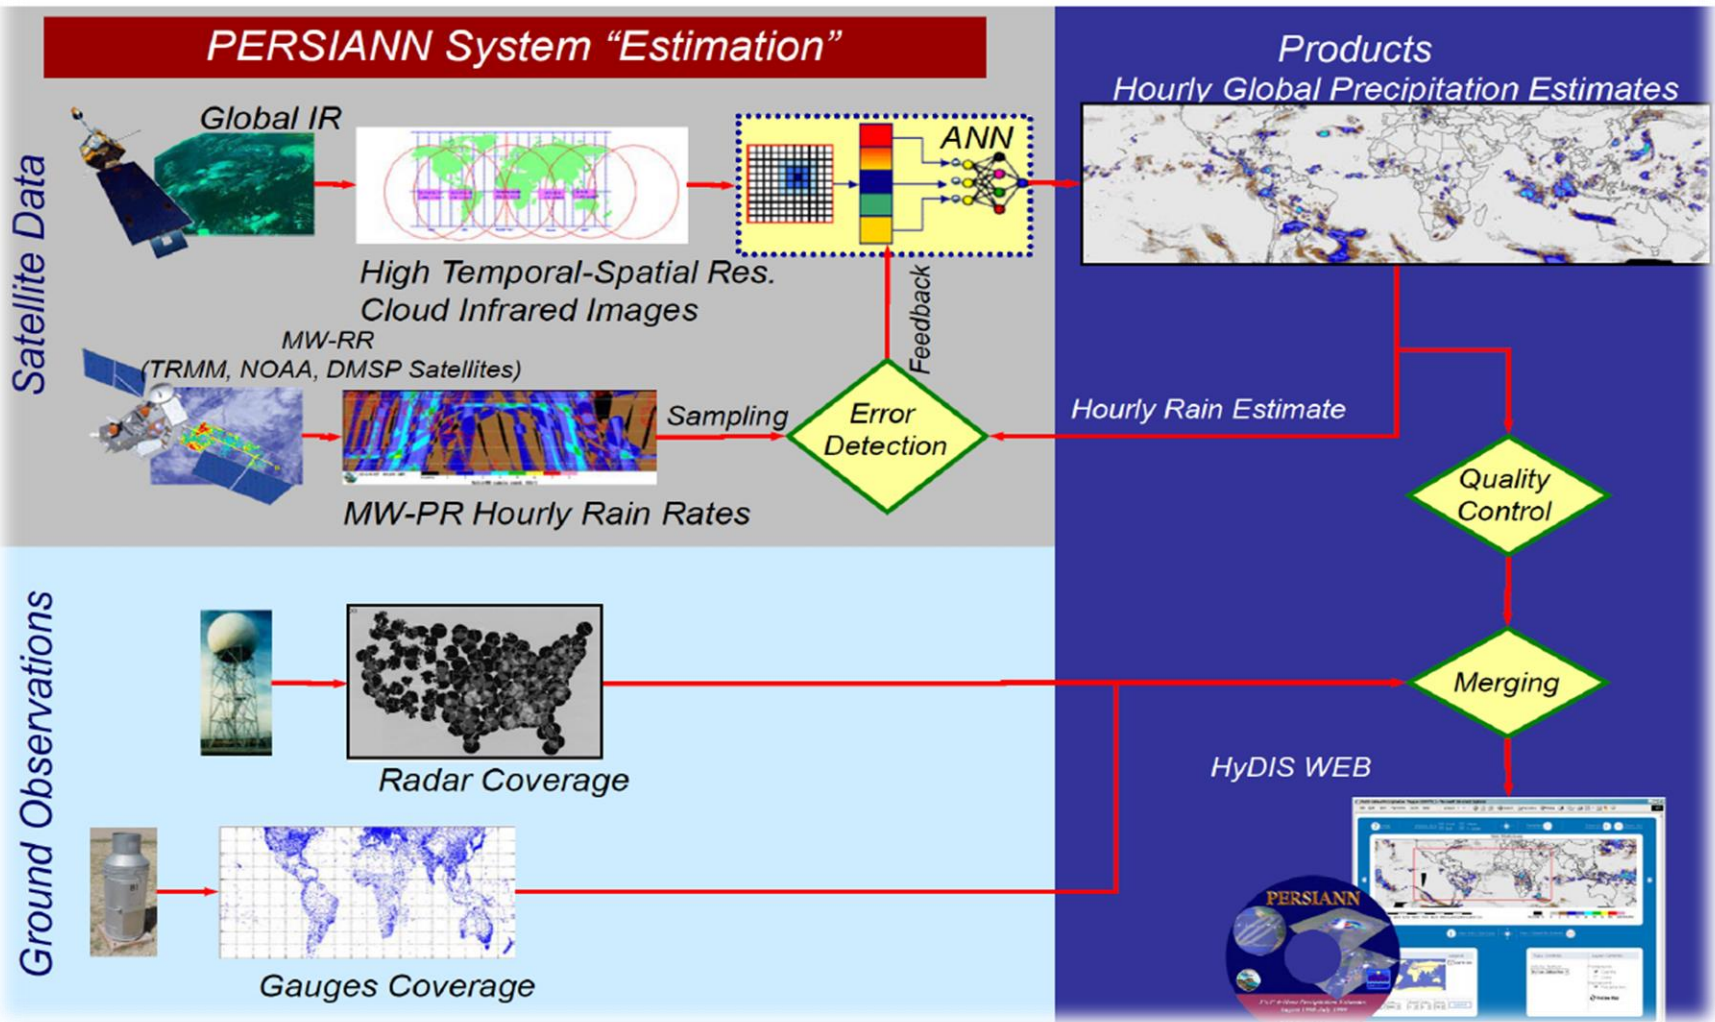

*TRMM precipitation RADAR
3D imaging of rainfall
1-2 days between overpasses
(S-35°N-35 °)*

Recommendation

- Since, the training has ToT (Training of Trainers) purposes, it is recommended to plan as soon as possible a national ToT training on Precipitation Estimation from Remotely Sensed Information using Artificial Neural Networks in Rwanda for different Institutions; especially Meteo-Rwanda for bias adjustment;
- For further implementation and sustainability of this project, researches and publications on collected data should be included and promoted by the Rwandan UNESCO National Commission and International Hydrologic Programme (IHP) National Committee planning in collaboration with Rwanda Meteorology Agency;
- All activities related to International Hydrologic Programme (IHP) should be communicated to the Ministry of Environment and related institutions to avoid any duplication and to negotiate means for usage and implementation;
- Working in interdisciplinary way and providing training's in GIS, MATLAB, R-Tool, ArcSWAT and other related modelling are compulsory and supplementary for more efficiency;
- Since this methodology to collect climatology data has a high resolution of 4 km², data from meteorological stations should be completed by those from this methodology collecting at well-known point with location using GPS to respond to microclimate report issues especially where data or accuracy are missing.

**Thank you for your kind
attention**
